

We tank a tank, add seawater, waste, and CO₂, then use our biology and engineering solutions to produce low environmental impact speciality chemicals. The remaining biomass becomes 'bulk' or low-value product. The heart of our business is the speciality chemicals, the environmental good comes from the rest.

We are developing ingredients for pharmaceuticals, cosmetics, nutraceuticals, and personal care. If you need a particular ingredient, please get in touch, we might just be able to become your next supplier.
